

Nonlinear Difference Equations: Theory with Applications to Social Science Models

Table of Contents

Preface

Acknowledgments

Part I: THEORY

1. PRELIMINARIES

2. DYNAMICS ON THE REAL LINE

1. Equilibria and their Stability
 - A. An inverse map characterization
 - B. Asymptotic stability
 - C. Nonlinear local stability
 - D. Further results
 - E. Notes
2. Cycles and Limit Cycles
 - A. Coexistence of cycles
 - B. Limit cycles
 - C. Notes
3. Elementary Bifurcations
 - A. The tangent bifurcation
 - B. The period-doubling bifurcation
 - C. Other one-parameter bifurcations
 - D. Notes

3. VECTOR DIFFERENCE EQUATIONS

1. Stability
 - A. The invariance principle
 - B. Boundedness and stability
 - C. Notes
2. Semiconjugates of Maps of the Line
 - A. Definitions and examples
 - B. The basic dynamics
 - C. Fiber bifurcations
 - D. Invariants
 - E. Semiconjugate links as Liapunov functions
 - F. Notes
3. Chaotic Maps
 - A. Chaos and period 3
 - B. Snap-back repellers: Beyond period 3
 - C. \mathbb{R} -semiconjugate maps and chaos
 - D. Notes

- 4. Polymodal Systems and Thresholds
 - A. Basic concepts and examples
 - B. Ejector cycles: Continuity revisited
 - C. Mode structures
 - D. Notes
4. HIGHER ORDER SCALAR DIFFERENCE EQUATIONS
- 1. Boundedness and persistent oscillations
 - A. Persistent oscillations
 - B. Absorbing intervals
 - C. The equation $x_{n+1} = cx_n + g(x_n - x_{n-1})$
 - D. Notes
 - 2. Permanence
 - A. Semi-permanence
 - B. The equation $x_n = x_{n-1}g(x_{n-1}, \dots, x_{n-m})$
 - C. Additional Equations
 - D. Notes
 - 3. Global attractivity and related results
 - A. Weak contractions and stability
 - B. Weak expansions and instability
 - C. Coordinate-wise monotonicity and global attractivity
 - D. The equation $x_{n+1} = \sum_{i=0}^m a_i x_{n-i} + g(\sum_{i=0}^m b_i x_{n-i})$
 - E. The equation $x_n = x_{n-k}^p [1 + g(\sum_{i=1}^m f_i(x_{n-i}))]$
 - F. Notes

Part II: APPLICATIONS TO SOCIAL SCIENCE MODELS

5. CHAOS AND STABILITY IN SOME MODELS
- 1. The Accelerator-Multiplier Business Cycle Models
 - A. The Goodwin-Hicks model
 - B. Full consumption of savings: Puu's model
 - C. The classical model of Hicks
 - D. Notes
 - 2. A Productivity Growth Model
 - A. The model
 - B. Stability and oscillations
 - C. Notes
 - 3. Chaos and competition in a model of consumer demand
 - A. The model
 - B. Snap-back repellors and chaotic behavior
 - C. Chaotic competition and exclusion
 - D. Notes
 - 4. An overlapping generations consumption-loan model
 - A. The model
 - B. Chaotic behavior
 - C. Notes

5. A dynamical model of consumer demand
 - A. The model
 - B. General asymptotics and stability
 - C. Demand functions and their properties
 - D. Notes
 6. A bimodal model of combat
 - A. The model
 - B. General asymptotics
 - C. Transient behavior
 - D. The invariant plane $z = 1$
 - E. Notes
6. ADDITIONAL MODELS
1. Addiction and habit formation
 2. Budgetary competition
 3. Cournot duopoly
 4. Chaos in real exchange rates
 5. Real wages and mode-switching
 6. Chaos in a dynamic equilibrium model
 7. Oscillatory behavior in an OLG model
 8. Attractor basins and critical curves in two models
 9. Reducing inflation: Gradual vs. shock treatments
 10. Walrassian tatonnement with adaptive expectations
 11. Socio-spatial dynamics
 12. Models of arms race
