

# Glow in the dark bunnies

March 19, 2007

[FULL NEWS INDEX >>](#)

SCIENTISTS have created rabbits that glow in the dark.

Geneticists in France produced the bunnies by inserting a gene from a fluorescent jellyfish into a rabbit's egg.

They are now selling the white bunnies to research laboratories.

Soon doctors will be able to use their genes to track the movement of cells throughout the body and monitor the success or failure of a transplant.
